

SUPERTOWEL

About Supertowel

It looks just like an ordinary towel, but it has a built-in antimicrobial layer that provides protection against pathogens. The Supertowel offers the user clean, germ-free hands even in situations where neither soap nor running water is within reach. The Supertowel offers a high-tech solution to a practical and very serious hygiene problem!

Facts

Handwashing is among the most effective and inexpensive ways to prevent infectious diseases. This simple behavior can save lives. Pathogens can spread from person to person by physical contact. Therefore, handwashing after contact with a potentially infected person, surface or object is an effective method to help protect yourself and others from infection.

Removes and kills pathogens

Supertowel has undergone clinical tests showing that it removes more pathogens than soap and water when used for handwashing. The antimicrobial layer on Supertowel is efficacious against bacteria, fungi and so-called encapsulated viruses. Supertowel as a handwashing tool removes pathogens from the hands and kill it. Additionally, Supertowel offers protection against infected surfaces i.e. door handles.

COVID-19

Even though the antimicrobial treatment on Supertowel is reported to be effective against enveloped viruses, and COVID-19 is an enveloped virus, we do not claim that Supertowel is efficacious against COVID-19. We suspect it is, but it has not been tested directly on the Supertowel. Such test are right now being discussed in a partnership between a number of US universities, the Humanitarian Innovation Fund and Real Relief.
